(54) Title: DATABASES SYNCHRONIZATION

(57) Abstract: The invention deals with database synchronization. A first database (DB1) is stored in a removable device for example a smartcard (CAR) communicating with a first system (MOB). A second database (DB2) of the same nature being stored in a second system (PDA) communicating with said first system. Said first and second system (MOB, PDA) comprises means able to generate synchronization objects defining the last database synchronization which has been performed between said two databases of said two systems. After each synchronization step of the first database (DB1) with the second database (DB2), a program external to the removable device (CAR) sends a command to the removable device (CAR) for setting a synchronization object to said first database (DB1), said synchronization object being also affected to the second database (DB2) which has been synchronized.
